

Two Channels: 2 x 100mΩ

Status Feedback

Suitable for 42V

Product Summary

Operating Voltage	$V_{bb(on)}$	7.0 ... 58V	
	Active channels	One	two parallel
On-state Resistance	R_{ON}	105mΩ	53mΩ
Nominal load current	$I_{L(NOM)}$	2.9A	4.2A
Current limitation	$I_{L(SCr)}$	8A	8A

Package

PG-DSO14

General Description

- N channel vertical power MOSFET with charge pump, ground referenced CMOS compatible input and diagnostic feedback, monolithically integrated in Smart SiPMOS® 80V technology.
- Providing embedded protective functions
- An array of resistors is integrated in order to reduce the external components

Applications

- μ C compatible high-side power switch with diagnostic feedback for 12V and 24V and **42V** grounded loads
- All types of resistive, inductive and capacitive loads
- Most suitable for inductive loads
- Replaces electromechanical relays, fuses and discrete circuits

Basic Functions

- CMOS compatible input
- Improved electromagnetic compatibility (EMC)
- Fast demagnetization of inductive loads
- Stable behaviour at undervoltage
- Wide operating voltage range
- Logic ground independent from load ground
- Optimized inrush current capability

Protection Functions

- Short circuit protection
- Overload protection
- Current limitation
- Thermal shutdown
- Overvoltage protection (including load dump) with external resistor
- Reverse battery protection with external resistor
- Loss of ground and loss of V_{bb} protection
- Electrostatic discharge protection (ESD)

Diagnostic Function

- Diagnostic feedback with open drain output and integrated pull up resistors
- Open load detection in OFF-state
- Feedback of thermal shutdown in ON-state
- Diagnostic feedback of both channels works properly in case of inverse current

Pin Definitions and Functions

Pin	Symbol	Function
1,7, 8,14,	V_{bb}	Positive power supply voltage. Design the wiring for the simultaneous max. short circuit currents from channel 1 to 2 and also for low thermal resistance
2	IN1	Input 1,2 activates channel 1,2 in case of logic high signal
6	IN2	
12,13	OUT1	Output 1,2 protected high-side power output of channel 1,2. Design the wiring for the max. short circuit current; both outputpins have to be connected in parallel for operation according this spec.
9,10	OUT2	
3	ST1	Diagnostic feedback 1,2 of channel 1,2 open drain
5	ST2	
4	GND	Logic Ground
11	SPU	Connection for external pull up voltage source for the open drain status output. Pull up resistors are integrated.

- 1) Current limit is a protection function. Operation in current limitation is considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.
- 2) Supply voltages higher than $V_{bb(AZ)}$ require an external current limit for the GND and status pins (a $150\ \Omega$ resistor for the GND connection is recommended).
- 3) R_l = internal resistance of the load dump test pulse generator
- 4) $V_{Load\ dump}$ is setup without the DUT connected to the generator per ISO 7637-1 and DIN 40839

¹⁴⁾ Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

¹⁵⁾ not subject to production test, specified by design

¹⁶⁾ If channels are connected in parallel, output clamp is usually accomplished by the channel with the lowest $V_{\text{ON}(\text{CL})}$

¹⁷⁾ Requires a 150 Ω resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Power dissipation is higher compared to normal operating conditions due to the voltage drop across the drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 4 and circuit page 10).

¹⁸⁾ not subject to production test, specified by design

¹⁹⁾ not subject to production test, specified by design

²⁰⁾ In case of an inverse current of 3A the both status outputs must not be disturbed.

The neighbour channel can be switched normally; not all parameters lay within the range of the spec

Please note, that in case of an inverse current no protection function is active. The power dissipation is

higher compared to normal operation in forward mode due to the voltage drop across the drain-source diode

Parallel switching of channel 1 and 2 is easily possible by connecting the inputs and outputs in parallel. In this mode it is recommended to use only one status.

Terms

Leadframe (V_{bb}) is connected to pin **1,7,8,14**

External R_{GND} optional; a single resistor $R_{GND} = 150\Omega$ for reverse battery protection up to the max. operating voltage.

Input circuit (ESD protection), IN1 or IN2

The use of ESD zener diodes as voltage clamp at DC conditions is not recommended.

Status output, ST1 or ST2

ESD-Zener diode: 6.1 V typ., $R_{ST(ON)} < 250 \Omega$,
 $R_{ST} = 850 \Omega$ typ., $R_{pull\ up} = 12\ k\Omega$ typ.
 The use of ESD zener diodes as voltage clamp at DC conditions is not recommended

Short Circuit detection

Fault Signal at ST-Pin: $V_{ON} > 4.0\ V$ typ, no switch off by the PROFET itself, external switch off recommended!

Inductive and overvoltage output clamp, OUT1 or OUT2

V_{ON} clamped to $V_{ON(CL)} = 64\ V$ typ.

Overvolt. and reverse batt. protection

$V_{Z1} = 6.1\ V$ typ., $V_{Z2} = 63\ V$ typ., $R_{GND} = 150\ \Omega$,
 $R_I = 850\ \Omega$ typ., $R_{ST} = 20\ k\Omega$ typ., $R_{pull\ up} = 12\ k\Omega$ typ
 In case of reverse battery the load current has to be limited by the load. Temperature protection is not active

Open-load detection, OUT1 or OUT2

OFF-state diagnostic condition:

Open load, if $V_{OUT} > 2.7 \text{ V}$ typ. (IN low)

$I_{L(OL)}$ typ. $2 \mu\text{A}$

An external resistor can be used to increase the open load detection current

GND disconnect

Any kind of load.

Due to $V_{GND} > 0$, no $V_{ST} = \text{low}$ signal available.

GND disconnect with GND pull up

Any kind of load. If $V_{GND} > V_{IN} - V_{IN(T+)}$ device stays off
Due to $V_{GND} > 0$, no $V_{ST} = \text{low}$ signal available.

V_{bb} disconnect with energized inductive load

For inductive load currents up to the limits defined by Z_L (max. ratings and diagram on page 12) each switch is protected against loss of V_{bb} .

Consider at your PCB layout that in the case of V_{bb} disconnection with energized inductive load all the load current flows through the GND connection.

Inductive load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = \frac{1}{2} \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for $R_L > 0 \Omega$:

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} (V_{bb} + |V_{OUT(CL)}|) \ln \left(1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$

Maximum allowable load inductance for a single switch off (one channel)⁵⁾

$L = f(I_L)$; $T_{j,start} = 150^\circ\text{C}$, $V_{bb} = 12\text{ V}$, $R_L = 0 \Omega$

Typ. on-state resistance

$R_{ON} = f(V_{bb}, T_j)$; $I_L = 2\text{ A}$, $I_N = \text{high}$

R_{ON} [mOhm]

Typ. standby current

$I_{bb(off)} = f(T_j)$; $V_{bb} = 9 \dots 34\text{ V}$, $I_{N1,2,3,4} = \text{low}$

$I_{bb(off)}$ [μA]
