

High Speed, Half Duplex iCoupler Isolated RS-485 Transceiver

FEATURES

- ▶ Half-duplex, isolated RS-485 transceiver
- ▶ PROFIBUS® compliant
- ▶ ANSI EIA/TIA 485-A and ISO 8482: 1987(E) compliant
- ▶ 20 Mbps data rate
- ▶ 5 V or 3 V operation (V_{DD1})
- ▶ High common-mode transient immunity: >25 kV/ μ s
- ▶ Isolated DE status output
- ▶ Receiver open-circuit, fail-safe design
- ▶ Thermal shutdown protection
- ▶ 50 nodes on bus
- ▶ Safety and regulatory approvals
 - ▶ UL 1577
 - ▶ $V_{ISO} = 2500$ V rms for 1 minute
 - ▶ IEC/CSA 62368-1
 - ▶ IEC/CSA 61010-1
 - ▶ DIN EN IEC 60747-17 (VDE 0884-17)
 - ▶ $V_{ORM} = 560$ V peak
- ▶ Operating temperature range: -40°C to $+85^{\circ}\text{C}$
- ▶ **Wide body, 16-lead SOIC package**

APPLICATIONS

- ▶ Isolated RS-485/RS-422 interfaces
- ▶ PROFIBUS networks
- ▶ Industrial field networks
- ▶ Multipoint data transmission systems

GENERAL DESCRIPTION

The ADM2486 differential bus transceiver is an integrated, galvanically isolated component designed for bidirectional data communication on multipoint bus transmission lines. It is designed for balanced transmission lines and complies with ANSI EIA/TIA-485-A and ISO 8482: 1987(E).

The device employs Analog Devices iCoupler® technology to combine a 3-channel isolator, a three-state differential line driver, and a differential input receiver into a single package. The logic side of the device is powered with either a 5 V or a 3 V supply, and the bus side uses an isolated 5 V supply.

The ADM2486 driver has an active-high enable feature. The driver differential outputs and the receiver differential inputs are connected internally to form a differential input/output port that imposes minimal loading on the bus when the driver is disabled or when V_{DD1} or $V_{DD2} = 0$ V. Also provided is an active-high receiver disable

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

feature that causes the receive output to enter a high impedance state.

The device has current-limiting and thermal shutdown features to protect against output short circuits and situations where bus contention may cause excessive power dissipation. The part is fully specified over the industrial temperature range and is available in a **16-lead, wide body SOIC package**.

SPECIFICATIONS

Table 1. (Continued)

Parameter	Min	Typ	Max	Unit	Test Conditions/Comments
COMMON-MODE TRANSIENT IMMUNITY ¹	25			kV/ μ s	$V_{CM} = 1$ kV, transient magnitude = 800 V
HIGH FREQUENCY, COMMON-MODE NOISE IMMUNITY		100		mV	$V_{HF} = +5$ V, -2 V < $V_{TEST2} < +7$ V, 1 MHz < $f_{TEST} < 50$ MHz, see Figure 6

¹ Common-mode transient immunity is the maximum common-mode voltage slew rate that can be sustained while maintaining specification-compliant operation. V_{CM} is the common-mode potential difference between the logic and bus sides. The transient magnitude is the range over which the common-mode is slewed. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted. All voltages are relative to their respective ground.

Table 7.

Parameter	Rating
V_{DD1}	-0.5 V to +7 V
V_{DD2}	-0.5 V to +6 V
Digital Input Voltage (RTS, $\overline{\text{RE}}$, TxD)	-0.5 V to $V_{DD1} + 0.5 \text{ V}$
Digital Output Voltage	
RxD	-0.5 V to $V_{DD1} + 0.5 \text{ V}$
DE	-0.5 V to $V_{DD2} + 0.5 \text{ V}$
Driver Output/Receiver Input Voltage	-9 V to +14 V
Operating Temperature Range	-40°C to +85°C
Storage Temperature Range	-55°C to +150°C
Average Output Current per Pin	-35 mA to +35 mA
θ_{JA} Thermal Impedance	73°C/W
Lead Temperature	
Soldering (10 sec)	260°C
Vapor Phase (60 sec)	215°C
Infrared (15 sec)	220°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

MAXIMUM CONTINUOUS WORKING VOLTAGE**Table 8. ADM2486 Maximum Continuous Working Voltage¹**

Parameter	Rating	Unit	Applicable Certification
AC Voltage			
Bipolar Waveform	560	V peak	Reinforced insulation rating per IEC 60747-17 (VDE 0884-17)

¹ Maximum continuous working voltage refers to the continuous voltage magnitude imposed across the isolation barrier.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2. Pin Configuration

Table 9. Pin Function Descriptions

PinNo.	Mnemonic	Description
1	V _{DD1}	Power Supply (Logic Side), 3 V or 5 V Supply. Decoupling capacitor to GND ₁ required, capacitor value should be between 0.01 μ F and 0.1 μ F.
2, 8	GND ₁	Ground (Logic Side).
3	RxD	Receiver Output Data. This output is high when (A – B) > 200 mV and low when (A – B) < –200 mV. The output is three-stated when the receiver is disabled, that is, when RE is driven high.
4	RE	Receiver Enable Input. This is an active-low input. Driving this input low enables the receiver, and driving it high disables the receiver.
5	RTS	Request to Send Input. Driving this input high enables the driver, and driving it low disables the driver.
6	TxD	Transmit Data Input. Data to be transmitted by the driver is applied to this input.
7	PV	Power_Valid. Used during power-up and power-down, needs to be tied high when the ADM2486 is operational, see the Applications Information section.
9, 15	GND ₂	Ground (Bus Side).
10	DE	Driver Enable Status Output. This output signals the driver enable or disable status to other devices on the bus. DE is high when the driver is enabled and low when the driver is disabled.
11, 14	NC	No Connect.
12	A	Noninverting Driver Output/Receiver Input. When the driver is disabled, or when V _{DD1} or V _{DD2} is powered down, Pin A is put into a high impedance state to avoid overloading the bus.
13	B	Inverting Driver Output/Receiver Input. When the driver is disabled, or when V _{DD1} or V _{DD2} is powered down, Pin B is put into a high impedance state to avoid overloading the bus.
16	V _{DD2}	Power Supply (Bus Side), 5 V Isolated Supply. Decoupling capacitor to GND ₂ required, capacitor value should be between 0.01 μ F and 0.1 μ F.

CIRCUIT DESCRIPTION

ELECTRICAL ISOLATION

In the ADM2486, electrical isolation is implemented on the logic side of the interface. Therefore, the part has two main sections: a digital isolation section and a transceiver section (see Figure 26). Driver input and request-to-send signals, applied to the TxD and RTS pins, respectively, and referenced to logic ground (GND₁), are coupled across an isolation barrier to appear at the transceiver section referenced to isolated ground (GND₂). Similarly, the receiver output, referenced to isolated ground in the transceiver section, is coupled across the isolation barrier to appear at the RxD pin referenced to logic ground.

iCoupler Technology

The digital signals are transmitted across the isolation barrier using iCoupler technology. This technique uses chip-scale transformer windings to couple the digital signals magnetically from one side of the barrier to the other. Digital inputs are encoded into waveforms that are capable of exciting the primary transformer winding. At the secondary winding, the induced waveforms are then decoded into the binary value that was originally transmitted.

Figure 26. ADM2486 Digital Isolation and Transceiver Sections

TRUTH TABLES

The truth tables in this section use these abbreviations:

Letter	Description
H	High level
I	Indeterminate
L	Low level
X	Irrelevant
Z	High impedance (off)
NC	Disconnected

Table 10. Transmitting

Supply Status		Inputs		Outputs ¹		
V _{DD1}	V _{DD2}	RTS	TxD	A	B	DE
On	On	H	H	H	L	H
On	On	H	L	L	H	H

On	On	X	H	Z
On	Off	X	L or NC	H
Off	On	X	L or NC	H
Off	Off	X	L or NC	L

¹ The PV pin is tied high.

POWER-UP/POWER-DOWN THRESHOLDS

The power-up/power-down characteristics of the ADM2486 are in accordance with the supply thresholds shown in Table 12. Upon power-up, the ADM2486 output signals (A, B, RxD, and DE) reach their correct state once both supplies have exceeded their thresholds. Upon power-down, the ADM2486 output signals retain their correct state until at least one of the supplies drops below its power-down threshold. When the V_{DD1} power-down threshold is crossed, the ADM2486 output signals reach their unpowered states within 4 μs.

Table 12. Power-Up/Power-Down Thresholds

Supply	Transition	Threshold (V)
V _{DD1}	Power-up	2.0
V _{DD1}	Power-down	1.0
V _{DD2}	Power-up	3.3
V _{DD2}	Power-down	2.4

THERMAL SHUTDOWN

The ADM2486 contains thermal shutdown circuitry that protects the part from excessive power dissipation during fault conditions. Shorting the driver outputs to a low impedance source can result in high driver currents. The thermal sensing circuitry detects the increase in die temperature under this condition and disables the driver outputs. This circuitry is designed to disable the driver outputs when a die temperature of 150°C is reached. As the device cools, the drivers are re-enabled at a temperature of 140°C.

CIRCUIT DESCRIPTION

RECEIVER FAIL-SAFE INPUTS

The receiver input includes a fail-safe feature that guarantees a logic high RxD output when the A and B inputs are floating or open-circuited.

MAGNETIC FIELD IMMUNITY

Because iCouplers use coreless technology, no magnetic components are present, and the problem of magnetic saturation of the core material does not exist. Therefore, iCouplers have essentially infinite dc field immunity. The following analysis defines the conditions under which this can occur. The ADM2486's 3 V operating condition is examined because it represents the most susceptible mode of operation.

The limitation on the iCoupler's ac magnetic field immunity is set by the condition in which the induced error voltage in the receiving coil (the bottom coil in this case) is made sufficiently large, either to falsely set or reset the decoder. The voltage induced across the bottom coil is given by

$$V = \left(\frac{-d\beta}{dt} \right) \sum \pi r_n^2; \quad n = 1, 2, \dots, N \quad (1)$$

where if the pulses at the transformer output are greater than 1.0 V in amplitude:

β = magnetic flux density (gauss).

N = number of turns in receiving coil.

r_n = radius of nth turn in receiving coil (cm).

The decoder has a sensing threshold of about 0.5 V; therefore, there is a 0.5 V margin in which induced voltages can be tolerated.

Given the geometry of the receiving coil and an imposed requirement that the induced voltage is, at most, 50% of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated as shown in Figure 27.

Figure 27. Maximum Allowable External Magnetic Flux Density

For example, at a magnetic field frequency of 1 MHz, the maximum allowable magnetic field of 0.2 kGauss induces a voltage of 0.25 V at the receiving coil. This is about 50% of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event occurs during a transmitted pulse and is the worst-case polarity, it reduces the received pulse from >1.0 V to 0.75 V. This is well above the 0.5 V sensing threshold of the decoder.

Figure 28 shows the magnetic flux density values in terms of more familiar quantities such as maximum allowable current flow at given distances away from the ADM2486 transformers.

Figure 28. Maximum Allowable Current for Various Current-to-ADM2486 Spacings

At combinations of strong magnetic field and high frequency, any loops formed by printed circuit board traces could induce sufficiently large error voltages to trigger the thresholds of succeeding circuitry. Care should be taken in the layout of such traces to avoid this possibility.

APPLICATIONS INFORMATION

PC BOARD LAYOUT

The ADM2486 isolated RS-485 transceiver requires no external interface circuitry for the logic interfaces. Power supply bypassing is strongly recommended at the input and output supply pins (see [Figure 29](#)). Bypass capacitors are most conveniently connected between Pin 1 and Pin 2 for V_{DD1} and between Pin 15 and Pin 16 for V_{DD2} . The capacitor value should be between 0.01 μF and 0.1 μF . The total lead length between both ends of the capacitor and the input power supply pin should not exceed 20 mm. Bypassing between Pin 1 and Pin 8 and between Pin 9 and Pin 16 should also be considered unless the ground pair on each package side is connected close to the package.

Figure 29. Recommended Printed Circuit Board Layout

In applications involving high common-mode transients, care should be taken to ensure that board coupling across the isolation barrier is minimized. Furthermore, the board layout should be designed such that any coupling that does occur equally affects all pins on a given component side. Failure to ensure this could cause voltage differentials between pins exceeding the device's **Absolute Maximum Ratings**, thereby leading to latch-up or permanent damage.

POWER VALID INPUT

To avoid chatter on the A and B outputs caused by slow power-up and power-down transients on V_{DD1} ($>100 \mu\text{s/V}$), the device features a power_valid (PV) digital input. This pin should be driven low until V_{DD1} exceeds 2.0 V. When V_{DD1} is greater than 2.0 V, this pin should be driven high. Conversely, upon power-down, PV should be driven low before V_{DD1} reaches 2.0 V (see [Figure 30](#)).

If the PV pin is driven with an open-drain output, the recommended value for the pull-up resistor is a 10 k Ω resistor, bypassed with a 100 pF capacitor to GND₁ (see [Figure 31](#)).

The power_valid input can be driven, for example, by the output of a system reset circuit, such as the [ADM809Z](#), which has a threshold voltage of 2.32 V.

ISOLATED POWER SUPPLY CIRCUIT

The ADM2486 requires isolated power capable of 5 V at up to approximately 75 mA (this current is dependent on the data rate and termination resistors used) to be supplied between the V_{DD2} and the GND_2 pins.

A transformer driver circuit with a center-tapped transformer and LDO can be used to generate the isolated 5 V supply, as shown in [Figure 32](#). The center-tapped transformer provides electrical isolation of the 5 V isolated power supply. The primary winding of the transformer is excited with a pair of square waveforms that are 180° out of phase with each other. A pair of Schottky diodes and a smoothing capacitor are used to create a rectified signal from the secondary winding. The [ADP667](#) linear voltage regulator provides a regulated 5 V power supply to the ADM2486's bus-side circuitry (V_{DD2}).
